Case Study

Value Chain Visibility
for European Aircraft Manufacturer

The client is an international pioneer in the aerospace industry with a revenue of € 66 billion.

Business Challenge

The client had no real-time visibility of critical assemblies that affect production planning, sequencing and resource management. Moreover, the high latency between ordering and procuring impacted the overall programming and scheduling.

LTI Solution

LTI developed and supported an Integrated platform for value chain visibility, which would connect data from multiple systems and applications in one place, enabling better visibility and faster decision-making.

It takes critical demand and supply data from the enterprise/ third-party applications, and provides rich dash-boards and event-driven alerts, to manage inventory situations proactively. The solution provided visibility to various stakeholders – from supplier to manufacturer to the supply chain team – for better visibility and robust decision support (for progress tracking, early warning on deviation, coordination, lean reporting, inventory insights, track & trace of consignment across value chain etc).

Business Benefits

95% improvement in visibility of sub-assembly movement	**22x** improved speed for RCA of stalled operations	**12%** OEE improved challenges
